

# How Air Moves in Your Home

"The Stack Effect"—the movement of air in and out of a home in the winter.

- ↑ Warm air rises and escapes through attic leaks.
- ↓ The drop in pressure draws cold outdoor air in through your basement or crawl space.

In the summer, the Stack Effect is reversed. Hot air enters the attic, pushing cooler indoor air out the bottom of your home.

## Symptoms of the Stack Effect

Indoor drafts, uneven home temperatures

High heating and cooling bills

Signs of allergens, moisture, and other outdoor pollutants

## The Solution

Air Sealing & Insulation

Conditioned Attics

Crawl Space Repair
